

GCSE Chemistry

Trilogy Science Paper 1

Flashcards

1 - Atomic Structure and the Periodic Table

2 - Structure, Bonding and Properties

3 - Quantitative Chemistry: Calculations

4 - Chemical Changes: Salts and Electrolysis

5 - Energy Changes

Name:

1 - Atomic Structure and the Periodic Table

Describe the structure of an atom.

- Atoms contain a nucleus (made of protons and neutrons)
- surrounded by electrons which orbit around in
- shells

Why are atoms neutral? (2 marks)

- The number of protons = the number of electrons
- The charges cancel

Where are elements with similar properties found in the periodic table?

- The same group (vertical column)
- E.g. group 1, group 2...

Which groups are the noble gases, the alkali metals and the halogens found in?

- Noble gases = group 0
- Alkali metals = group 1
- Halogens = group 7

In the periodic table, where are the mass number and atomic number found and what do they tell you about an element?

- Mass number: protons + neutrons
- Atomic number: protons (same as the number of electrons)

A diagram of an Aluminium atom. The nucleus is shown with red and blue spheres. The mass number '27' is written above the element symbol 'Al' and the atomic number '13' is written below it. Text boxes with arrows point to these numbers: 'This is the **MASS NUMBER.** It's the total number of **PROTONS** and **NEUTRONS.**' and 'This is the **ATOMIC NUMBER.** It's the number of **PROTONS.**'

Draw an atom of chlorine (1 mark)

Write the electron configuration of sodium (1 mark)

- 2,8,1

(you need to be able to do this for every element up to Ca)

Describe and explain the trend in reactivity down group 1 (4 marks)

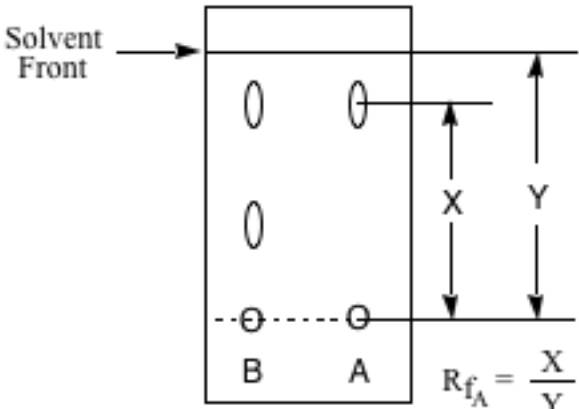

- Reactivity increases down group 1
- Atoms get bigger (more shells)
- Outer electron gets further away from the nucleus.
- Attraction between nucleus and outer electron is weaker.
- Electron more easily lost.

Describe and explain the trend in reactivity down group 7 (4 marks)

- Reactivity decreases down group 7
- Atoms get bigger
- Electron being gained is further from the nucleus
- Therefore attraction is weaker
- So electron is harder to gain

Describe and explain the importance of the work of Mendeleev (3 marks)

- He left gaps for undiscovered elements
- He ordered atoms in order of their atomic weight
- He organised elements into groups based on their reactivity

<p>Describe the process of filtration</p> <ul style="list-style-type: none"> Used to separate an insoluble solid from a liquid e.g. to separate sand from water 	<p>Describe the process of evaporation</p> <ul style="list-style-type: none"> Used to separate a soluble solid from a liquid e.g. to separate salt from saltwater
<p>Describe the process of distillation</p> <ul style="list-style-type: none"> Used to separate a soluble solid from a liquid and keep both the liquid and the solid. 	<p>Describe the process of chromatography and explain why it is used (<i>Required Practical 6</i>)</p> <ul style="list-style-type: none"> Used to separate inks. <p>Method:</p> <ul style="list-style-type: none"> Place a pencil line on a piece of chromatography paper (stationary phase) Use pencil so ink doesn't run Place dots of known inks and an unknown ink on the line. Place in the solvent (mobile phase) in a beaker (below the pencil baseline) Leave to develop Remove and leave to dry. Compare known with unknown to identify what inks are in the unknown sample. Calculate Rf values
<p>Calculating Rf values:</p> <ul style="list-style-type: none"> VALUE WILL ALWAYS BE LESS THAN 1  <p>A = pure compound B = mixture</p>	<p>List the properties of transition metals</p> <ul style="list-style-type: none"> Form coloured compounds Conduct electricity Conduct heat Malleable (can be hammered into shapes) Ductile (can be pulled into wires) Hard Strong High melting points

2 - Structure, Bonding and Properties

Describe ionic bonding (4 marks)

1. Between a metal and a non-metal.
2. Transfer of electrons from the metal to the non-metal.
3. Produces a positive metal ion and a negative non-metal ion.
4. Oppositely charged ions held together by an electrostatic interaction.

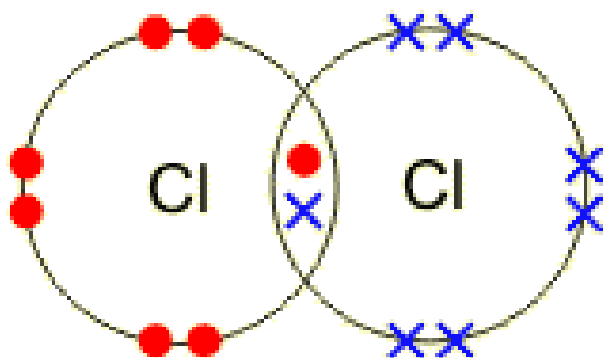

e.g. NaCl, CaCl₂, MgO, Na₂O... Make sure you use the example in the question

eg: Na transfers one electron to chlorine to form Na⁺ and Cl⁻. Ions held together by an electrostatic interaction.

Draw HCl (2 marks)

Draw Cl₂

Draw O₂

Draw CO₂

**You have to be able to draw the covalent bond between a variety non-metals*

Draw CH₄

Draw NaCl

sodium ion,
Na⁺ [2,8]⁺

chloride ion,
Cl⁻ [2,8,8]⁻

Draw MgO

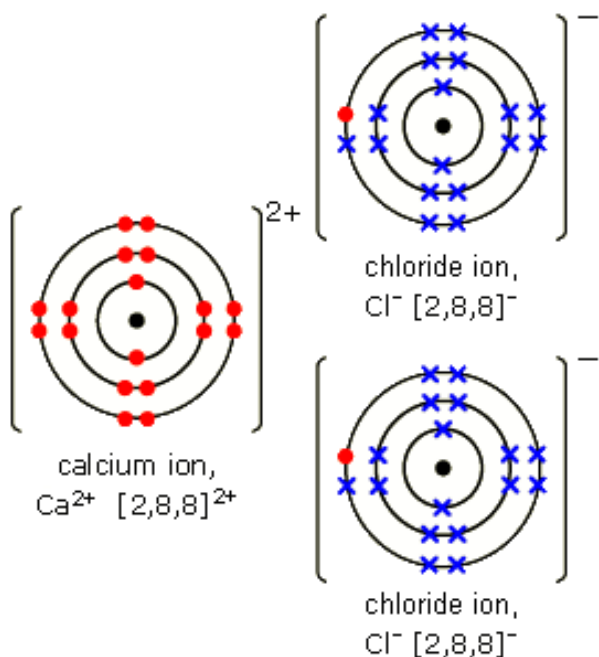

magnesium ion,
Mg²⁺ [2,8]²⁺

oxide ion,
O²⁻ [2,8]²⁻

**You have to be able to draw the ionic bond between a variety of metals and non-metals*

Draw CaCl₂

What is the formula of the ionic compound formed between magnesium and chlorine?

1. Write down the charges on your ions:

Group 1 = +1

Group 2 = +2

Group 3 = +3

Group 6 = -2

Group 7 = -1

Complex ions:

Nitrate = NO₃⁻

Sulphate = SO₄²⁻

hydroxide = OH⁻

2. Magnesium = Mg²⁺

3. Chloride = Cl⁻

4. Drop the charge, swap the number:

Describe the structure and bonding in a metal?
(2 marks)

- Lattice of positive metal ions
- Surrounded by a sea of delocalised electrons.

What are the different allotropes of carbon?
(allotrope = different forms of the same element)

- Diamond
- Graphite
- Graphene (one sheet of graphite)
- Graphane
- Fullerenes (football shaped)
- Carbon nanotubes

Why are atoms neutral?
(2 marks)

- Equal number of positive protons and negative electrons
- Cancel.

Why do graphite/grapheme/fullerenes/carbon nanotubes conduct electricity?
(3-4 marks)

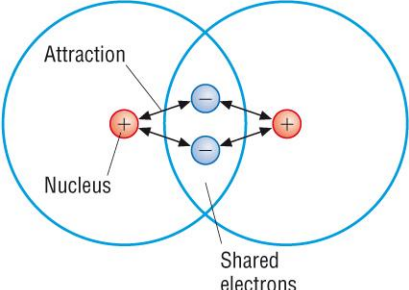

- Delocalised electrons
- Between the layers
- Free to move
- Carry charge
- Each C has 3 bonds.

Why to atoms react?
(1 mark)

- To gain a full outer shell.

Why is graphite slippery? / Why can graphite be used in pencils?
(asking the same thing!)
(3 marks)

- Weak interactions/forces
- Between the layers
- Easy to break.

<p>What is a covalent bond? (2-3 marks)</p> <ul style="list-style-type: none"> • <u>Shared pair</u> of electrons • Between <u>2 non-metals</u> <p>HT answer:</p> <ul style="list-style-type: none"> • <u>Electrostatic attraction</u> between the • <u>Positive nuclei</u> and the • <u>Shared pair</u> of negative <u>electrons</u> 	<p>Why does silicon dioxide have a high melting point? / Why can silicon dioxide be used to line furnaces? <i>(asking the same thing!)</i> (4-5 marks)</p> <ul style="list-style-type: none"> • Each <u>Si has 4 bonds</u> and each <u>O has 2 bonds</u>. • All bonds are <u>covalent</u>. • <u>Giant covalent</u> structure. • Many <u>strong</u> covalent bonds need to be broken • So has a <u>high melting point</u>.
<p>How does the covalent bond between HCl form? (3 marks)</p> <ul style="list-style-type: none"> • H has 1 outer shell electron • Cl has 7 outer shell electrons • Each <u>share 1 electron</u> to get a <u>full outer shell</u>. 	<p>Why can ionic compounds NOT conduct electricity when solid? (2 marks)</p> <ul style="list-style-type: none"> • <u>Ions</u> • <u>In fixed position</u> in the ionic lattice • Cannot carry charge.
<p>Why do simple molecules have low boiling points? / Why is methane a gas at room temperature? <i>(asking the same thing!)</i> (3 marks)</p> <ul style="list-style-type: none"> • <u>Weak interactions/forces</u> • <u>Between molecules</u> • <u>Easy to break</u>. 	<p>Why can ionic compounds conduct electricity when molten? (2 marks)</p> <ul style="list-style-type: none"> • <u>Ions</u> • <u>Free to move and carry charge</u>
<p>Why do simple molecules NOT conduct electricity? (2 marks)</p> <ul style="list-style-type: none"> • <u>No delocalised electrons</u> so • <u>Cannot carry a charge</u>. 	<p>Why does diamond NOT conduct electricity? (2 marks)</p> <ul style="list-style-type: none"> • <u>No delocalised electrons</u> so • <u>Cannot carry a charge</u>.
<p>Why is diamond hard? (4-5 marks)</p> <ul style="list-style-type: none"> • Each carbon has <u>4 covalent bonds</u> • <u>Giant covalent</u> structure • <u>Strong</u> bonds hard to break. 	<p>Why can metals conduct electricity? / Why is copper used in wires? <i>(asking the same thing!)</i> (2-3 marks)</p> <ul style="list-style-type: none"> • <u>Delocalised electrons</u> • <u>Free to move and carry charge through the metal structure</u>.

Why does diamond have high melting point?
(4 marks)

- Each C has 4 bonds
- All bonds are covalent.
- Giant covalent structure.
- Many strong covalent bonds need to be broken
- So has a high melting point.

Explain the difference in boiling point of HCl and NaCl.
(6 marks)

*** you can be asked to compare the boiling point of any two compounds so you need to make sure you can work out what the bonding is!***

- HCl is simple covalent
- Exists as molecules
- Weak interactions between molecules
- Easy to break

- NaCl is ionic
- Exists in 3D ionic lattice
- Strong electrostatic attraction
- Between Na⁺ and Cl⁻/oppositely charged ions
- Need a lot of energy to break

- So NaCl has a higher boiling point than HCl

Draw the structure of a metal (2 marks)

Why can metals be hammered into shapes?
(2 marks)

- Layers of metal ions
- Slide over each other.
- This does not disrupt the structure of the metallic bond.

How big are nanoparticles?

One billionth of a metre.

Or

10⁻⁹m

Or

Very tiny

What is the difference between thermosetting and thermosoftening polymers?

Thermosetting polymers have cross-linked chains. They are formed by putting them into a mould and heating. The resulting structure cannot be reshaped.

What are the environmental advantages and disadvantages of using nanoparticles?

- Advantages: long-lasting (e.g. using in tennis balls), antibacterial properties (e.g. used in smelly socks).
- Disadvantages: Could be toxic if they entered the bloodstream.

Thermosoftening polymers have weak interactions between polymer chains. They can be reshaped when heated.

Draw and name the polymer formed by ethene
(4 marks)

- 1 – for n before monomer
- 2 – for breaking double bond and drawing 2 bonds outside of brackets
- 3 – for brackets
- 4 – name = poly(ethene)

Sketch the structure of graphite (2 marks)

3 - Quantitative Chemistry: Calculations

<p>What is the relative molecular mass, Mr?</p> <p>The sum of the mass numbers in a molecule or compound</p>	<p>What is the Mr of LiCl?</p> <p>$3 + 35.5 = 38.8$</p>									
<p>What is the Mr of Ca(OH)₂</p> <p>$40 + (2 \times 16) + (2 \times 1) = 74$</p>	<p>What equation links mass, molecular mass and moles?</p> <p>Mass = molecular mass x moles</p> <p style="text-align: center;">$m = Mr \times n$</p>									
<p>Rearrange $m = Mr \times n$ to calculate n.</p> <p>$n = m / Mr$</p>	<p>What equation links moles, concentration and volume?</p> <p>Moles = concentration (in mol/dm³) x volume (in dm³)</p> <p style="text-align: center;">$n = c \times v$</p>									
<p>What equation links mass, concentration and volume?</p> <p>Mass (in g) = concentration (in g/dm³) x volume (in dm³)</p> <p style="text-align: center;">$m = c \times v$</p>	<p>What is the maximum mass of magnesium oxide that can be formed from 5 g of Magnesium and 12 g of oxygen? (4 marks) – <i>Limiting reagent question! (They have given you information about both reactants)</i></p> <p style="text-align: center;">$2Mg + O_2 \rightarrow 2MgO$</p> <ol style="list-style-type: none"> 1. Work out the moles of Mg 2. Work out the moles of O₂ 3. Work out which moles are in excess and which are limiting – <i>the limiting you use in your reacting masses calculation.</i> 4. Write down the Mr of the limiting reagent and MgO 5. Work out the molar ratio 6. Work out the moles of MgO that would be produced 7. Work out the mass of MgO <p style="text-align: center;">$2Mg + O_2 \rightarrow 2MgO$</p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse; text-align: center;"> <tr> <td style="padding: 2px;">$m = 5g$</td> <td style="padding: 2px;">$m = 12g$</td> </tr> <tr> <td style="padding: 2px;">$Mr = 24$</td> <td style="padding: 2px;">$Mr = 16$</td> </tr> <tr> <td style="padding: 2px;">$n = 5/24 = 0.21$</td> <td style="padding: 2px;">$n = 12/16 = 0.75$</td> </tr> </table>	$m = 5g$	$m = 12g$	$Mr = 24$	$Mr = 16$	$n = 5/24 = 0.21$	$n = 12/16 = 0.75$			
$m = 5g$	$m = 12g$									
$Mr = 24$	$Mr = 16$									
$n = 5/24 = 0.21$	$n = 12/16 = 0.75$									
<p>What is the maximum mass of magnesium oxide that can be formed from 5 g of Magnesium? (3 marks)</p> <p style="text-align: center;">$2Mg + O_2 \rightarrow 2MgO$</p> <ol style="list-style-type: none"> 1. Work out the moles of Mg 2. Write down the Mr of Mg and MgO 3. Work out the molar ratio 4. Work out the moles of MgO that would be produced 5. Work out the mass of MgO <p style="text-align: center;">$2Mg + O_2 \rightarrow 2MgO$</p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse; text-align: center;"> <tr> <td style="padding: 2px;">$m = 5g$</td> <td style="padding: 2px;">$m = 40 \times 0.21 = \mathbf{8.3g}$</td> </tr> <tr> <td style="padding: 2px;">$Mr = 24$</td> <td style="padding: 2px;">$Mr = 24 + 16 = 40$</td> </tr> <tr> <td style="padding: 2px;">$n = 5 / 24 = 0.21$</td> <td style="padding: 2px;">$n = 0.21$ (as 1:1)</td> </tr> </table> <p style="margin-top: 10px;"><i>*you have to be able to do this for any equation with any ratio and any quantities given</i></p>	$m = 5g$	$m = 40 \times 0.21 = \mathbf{8.3g}$	$Mr = 24$	$Mr = 24 + 16 = 40$	$n = 5 / 24 = 0.21$	$n = 0.21$ (as 1:1)	<p>0.21 moles of Mg needs $0.21/2 = 0.105$ moles of O₂ We have 0.75 g of O₂, so O₂ is in excess and Mg is limiting – USE MOLES OF Mg:</p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse; text-align: center;"> <tr> <td style="padding: 2px;">$m = 40 \times 0.21 = \mathbf{8.3g}$</td> </tr> <tr> <td style="padding: 2px;">$Mr \text{ MgO} = 24 + 16 = 40$</td> </tr> <tr> <td style="padding: 2px;">$n = 0.21$ (as 1:1)</td> </tr> </table> <p style="margin-top: 10px;"><i>*you have to be able to do this for any equation with any ratio and any quantities given</i></p>	$m = 40 \times 0.21 = \mathbf{8.3g}$	$Mr \text{ MgO} = 24 + 16 = 40$	$n = 0.21$ (as 1:1)
$m = 5g$	$m = 40 \times 0.21 = \mathbf{8.3g}$									
$Mr = 24$	$Mr = 24 + 16 = 40$									
$n = 5 / 24 = 0.21$	$n = 0.21$ (as 1:1)									
$m = 40 \times 0.21 = \mathbf{8.3g}$										
$Mr \text{ MgO} = 24 + 16 = 40$										
$n = 0.21$ (as 1:1)										

What is a titration?

A neutralisation reaction used to find the unknown concentration of the acid or alkali using a known concentration of the other.

(required practical 2)

Name the apparatus used in a titration.

Calculate the concentration of sodium hydroxide if 25 cm³ needed 23.25 cm³ of 0.1 mol/dm³ hydrochloric acid for neutralisation (3 marks) **(HT only)**

1. Write down the volumes in dm³ (cm³ /1000) of HCl and NaOH
2. Write down the concentration of HCl
3. Calculate the moles of HCl
4. Calculate the molar ratio
5. Calculate the concentration of NaOH

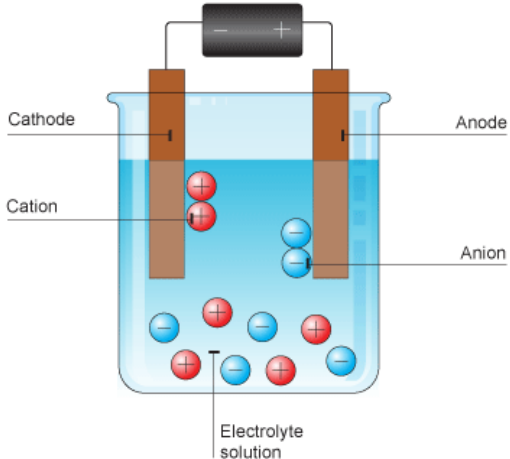

$n = 0.1 \times 0.02325$ $= 0.002325$	$n = 0.002325$
$c = 0.1 \text{ mol/dm}^3$	$c = 0.002325/0.025$ $= \underline{\underline{0.093 \text{ mol/dm}^3}}$
$v = 0.02325 \text{ dm}^3$	$v = 0.025 \text{ dm}^3$

**you have to be able to do this for any equation with any ratio and any quantities given*

4 - Chemical Changes: Salts and Electrolysis

<p>What is oxidation in terms of oxygen? (1 mark)</p> <p>Gain of oxygen</p>	<p>What is reduction in terms of oxygen? (1 mark)</p> <p>Loss of oxygen</p>								
<p>What are oxidation and reduction in terms of electrons? (2 marks)</p> <p><u>O</u>xidation <u>i</u>s <u>l</u>oss of electrons</p> <p><u>R</u>eduction <u>i</u>s <u>g</u>ain of electrons</p> <p style="text-align: center;">Think OILRIG!</p>	<p>Are the following oxidation or a reduction?</p> <p>1. $\text{Na}^+ + \text{e}^- \rightarrow \text{Na}$ Reduction</p> <p>2. $2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{e}^-$ (Can also be written $2\text{Cl}^- - 2\text{e}^- \rightarrow \text{Cl}_2$) Oxidation</p>								
<p>Examples of acids:</p> <ul style="list-style-type: none"> Hydrochloric acid (HCl) Sulphuric acid (H₂SO₄) Nitric acid (HNO₃) <p>Examples of alkalis:</p> <ul style="list-style-type: none"> Metal hydroxide (e.g. sodium hydroxide, NaOH) Metal oxide (e.g. sodium oxide, Na₂O) 	<p>Naming salts</p> <p>The salt produced is named from the acid used:</p> <table border="1" style="width: 100%; text-align: center;"> <thead> <tr> <th>Acid used</th> <th>Metal salt produced</th> </tr> </thead> <tbody> <tr> <td>Hydrochloric acid</td> <td>Chloride</td> </tr> <tr> <td>Sulphuric acid</td> <td>Sulphate</td> </tr> <tr> <td>Nitric acid</td> <td>nitrate</td> </tr> </tbody> </table>	Acid used	Metal salt produced	Hydrochloric acid	Chloride	Sulphuric acid	Sulphate	Nitric acid	nitrate
Acid used	Metal salt produced								
Hydrochloric acid	Chloride

<p>Describe the electrolysis of brine/sodium chloride solution/ NaOH_(aq) and explain why three products are made (6 marks)</p> <ul style="list-style-type: none"> Ions in solution = Na⁺, Cl⁻, H⁺ and OH⁻ Na⁺ and Cl⁻ from sodium chloride H⁺ and OH⁻ from the water (solution) H⁺ moves to negative electrode to produce hydrogen gas (H₂) <ul style="list-style-type: none"> Half equation: $2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$ Cl⁻ moves to positive electrode to produce chlorine gas (Cl₂) <ul style="list-style-type: none"> Half equation: $2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{e}^-$ Na⁺ and OH⁻ left in solution form sodium hydroxide (NaOH). <p>**THE MOST REACTIVE POSITIVE ION STAYS IN SOLUTION</p>	<p>Describe the process of electrolysis of aluminium oxide (Al₂O₃), stating the products and explaining how they are formed (6 marks)</p> <ul style="list-style-type: none"> Heated until molten (melted) <u>Cryolite</u> added to lower melting point Ions = Al³⁺ and O²⁻ Al³⁺ moves to negative electrode to produce aluminium (Al) <ul style="list-style-type: none"> Half equation = $\text{Al}^{3+} + 3\text{e}^- \rightarrow \text{Al}$ O²⁻ moves to positive electrode to produce oxygen (O₂) <ul style="list-style-type: none"> Half equation = $2\text{O}^{2-} \rightarrow \text{O}_2 + 4\text{e}^-$ O₂ reacts with carbon electrodes to form carbon dioxide (CO₂) <ul style="list-style-type: none"> $\text{C(s)} + \text{O}_2(\text{g}) \rightarrow \text{CO}_2(\text{g})$ Carbon electrodes therefore need to be replaced frequently as they wear away.

State the chemical tests for the products of electrolysis of $\text{NaOH}_{(aq)}$ and describe their uses (6 marks)

Test for products:

- Cl_2 – bleaches litmus paper
- H_2 – lit splint pops
- NaOH (pH 14) – turns universal indicator paper blue

Uses of products:

- Cl_2 – bleach
- H_2 – making margarine
- NaOH - making soap

2 types of electrolysis:

1. Molten

e.g. $\text{PbBr}_2(l)$

Look at the state symbol!

Ions present: Pb^{2+} Br^-

2. Aqueous

e.g. $\text{CaCl}_2(aq)$

Ions present: Ca^{2+} Cl^- H^+ OH^-

**In aqueous electrolysis, THE MOST REACTIVE + ION STAYS IN SOLUTION and the LEAST REACTIVE FORMS THE PRODUCT at the cathode.

At the anode, if NO_3^- , OH^- or SO_4^{2-} are present, oxygen is produced.

Writing half-equations:

1. Look at the charge on the ion
2. Swap it around to write the number of electrons

e.g. $\text{Ca}^{2+} + 2e^- \rightarrow \text{Ca}$

e.g. $2\text{O}^{2-} - 4e^- \rightarrow \text{O}_2$

List the metals that can be extracted using carbon (reduction).

Zinc
Iron
Tin
Lead
Copper

The Reactivity Series (*learn!*)

Potassium	Most reactive	K
Sodium	↑ ↓	Na
Calcium		Ca
Magnesium		Mg
Aluminium		Al
Carbon		C
Zinc		Zn
Iron		Fe
Tin		Sn
Lead		Pb
Hydrogen		H
Copper		Cu
Silver		Ag
Gold		Au
Platinum		Least reactive

A more reactive element can displace a less reactive element within a compound.

e.g. $\text{CuSO}_4 + \text{Mg} \rightarrow \text{MgSO}_4 + \text{Cu}$

Which metals do not need to be extracted and why?

Gold
Platinum

Are unreactive and so exist native. They exist as pure elements and do not need to be extracted from compounds.

Which elements need to be extracted by electrolysis and why?

Potassium
Sodium
Calcium
Magnesium
Aluminium

They are too reactive and therefore cannot be displaced by carbon from their compounds

5 - Energy Changes

Define exothermic (2 marks)

- Gives out heat energy
 - To the surroundings
- ΔH is negative

Define endothermic (2 marks)

- Take in heat energy
 - From the surroundings
- ΔH is positive

Describe a simple experiment you could do to find out whether a reaction is exothermic or endothermic.

- Measure the change in temperature.
- If the temperature increases (gets hotter) = exothermic
- If the temperature decreases (gets colder) = endothermic

Enthalpy change (ΔH) using bond enthalpies:

$\Delta H = \text{Sum of bonds broken} - \text{sum of bonds made}$

Calculate the enthalpy change of the following reaction using the following bond enthalpies:

Bond	Mean bond enthalpy (kJ/mol)
C-H	412
O=O	498
C=O	743
O-H	463

$$\begin{aligned} \Delta H &= [(4 \times 412) + (2 \times 498)] - [(2 \times 743) + (4 \times 463)] \\ &= [1648 + 996] - [1486 + 1852] \\ &= 2644 - 3338 \\ &= \underline{\underline{-694 \text{ kJ/mol}}} \end{aligned}$$

** you have to be able to do this for any equation

Describe how you could determine the point of neutralisation in an acid-base reaction by measuring the temperature.

(Required practical 4)

- Add 25 cm³ of acid to a polystyrene cup (for insulation)
- Record the start temperature
- Add 5 cm³ of alkali and record the temperature
- Add 5 cm³ of alkali until you have added 40 cm³ in total, recording the temperature each time.
- Plot a graph of volume of alkali added (x axis) against temperature (y axis)
- Draw two lines of best fit.
- Find the intersect of the two lines and read the value off the x-axis: This is the volume of alkali needed to neutralise the 25cm³ of acid.

**Use the values in the question (the values here are just an example)

Acid/alkali may be the other way around – read the question!

What equation can be used to calculate the heat energy released by a reaction?

$$q = m \times c \times \Delta T$$

heat energy (J) = mass of **water** x specific heat capacity of water (4.2) x change in temperature

What equation allows us to calculate the enthalpy change of a reaction in kJ/g?

$$\Delta H = q / \text{mass of **fuel** burned (g)}$$

What equation allows us to calculate the enthalpy change of a reaction in kJ/mol?

$$\Delta H = q / \text{moles of **fuel** burned (moles)}$$

**Remember moles = mass / Mr!!

1.5 g of ethanol (C₂H₅OH) was burned. This caused the temperature of 50 cm³ of water to rise by 14 °C. Calculate the enthalpy change for the reaction in kJ/mol.

$$\begin{aligned}q &= mc\Delta T \\ &= 50 \times 4.2 \times 14 \\ &= 2940 \text{ J}\end{aligned}$$

$$\begin{aligned}n &= m/M_r \\ &= 1.5 / ((12 \times 2) + 16 + 6) \\ &= 1.5 / 46 \\ &= 0.0326 \text{ moles of ethanol}\end{aligned}$$

$$\begin{aligned}\Delta H &= q/n \\ &= 2.940 \text{ KJ} / 0.0326 \quad \leftarrow \text{don't forget to convert q to kJ} \\ &= \underline{\underline{-90.18 \text{ kJ/mol}}} \quad \leftarrow \text{add - sign as reaction gets hotter so is exothermic}\end{aligned}$$

1.2 g of ethanol (C₂H₅OH) was burned. This caused the temperature of 100 cm³ of water to rise by 8 °C. Calculate the enthalpy change for the reaction in kJ/g.

$$\begin{aligned}q &= mc\Delta T \\ &= 100 \times 4.2 \times 8 \\ &= 3360 \text{ J}\end{aligned}$$

$$\begin{aligned}\Delta H &= q/m \\ &= 3.360 \text{ KJ} / 1.2 \quad \leftarrow \text{don't forget to convert q to kJ} \\ &= \underline{\underline{-2.8 \text{ kJ/mol}}} \quad \leftarrow \text{add - sign as reaction gets hotter so is exothermic}\end{aligned}$$
